

A Checklist of the birds of Chasewater

These tables show the main status of all of Chasewater's 231 officially recorded species.

Resident – birds that can be seen throughout the year and in most cases at least attempt to breed.

Winter – species that peak in the winter months due to local movements or migration from northern Europe.

Spring/Autumn – birds that generally have peak numbers passing through on long distance migrations but one or two species may stop to nest. A small number involve local movements of feral birds.

Summer - species that have mainly wintered in Africa and attempt to breed at Chasewater.

Rarities – species that have been recorded in fewer than five of the last ten years and in some cases have only ever been seen at Chasewater on one occasion.

The species names used are those recommended by *British Birds*, January 2004.
